

RESEARCH CHEMICALS

What They Are?

Buy Crystal Meth Online. These are synthetic chemicals that are made in the laboratory and mimic the effects of illicit drugs. They were first synthesized by Alexander Shulgin in 1991 and he is known as the godfather of psychedelics. These doping chemicals are made of up two psychoactive substances: the tryptamines and the phenethylamines which have a range of hallucinogenic effects. They include MDMA (ecstasy), mescaline, DMT, AMT, 5-MEO-DiPT(foxy), Nexus, Blue Mystic. Doping chemicals have a long history of spiritual and illicit use for recreational environments like the club and rave. They often come as a white crystalline powder, mostly white. They are labeled research chemicals in order to evade law enforcement efforts. They were first known as pharmaceutical chemicals but are now research chemicals. Latest research chemicals include. - Mephedrone and desoxypipradol which are stimulants.
- Premazepam as sedatives.
- Viagra (knockoffs).
- Training drugs
- Cannaboids (weed and marijuana)

What to Know Before Taking Research Chemicals

- They are experimental drugs that can produce euphoria, thus they have both research and recreational uses.
- Some are regulated by law and others while are not and can be gotten from the dark web or black market.
- Being legal doesn't mean that it is safe.
- They are not tested on humans and could have long and short term effects.
- They may involve a lot of risks but there are hardly ever any.
- When consuming them, take a small dose first to test your ability then redoes if you are able to take more.
- Reactions too may vary from one person to another depending on their genes, quantity taken, other substances consumed with.
- They are recreational drugs and are uncontrolled and unregulated din some parts of the world.
- They are often sold in vials and can be constituted with sterile water.

How research chemicals are taken.

Research chemicals often come as a white crystalline powder and can be taken orally, snuffed or intravenously. Orally, it is either applied on the gums or even mixed with beverages like

fruits juice and others then consumed. A transparent glass tube can also be used to snuff the substance into the body via the nostrils. Or the powder can even be dissolved using distilled water and injected intravenously. Other methods can also be used ut whatever the method if taking for the first time, start with a small quantity and redoes if you get the feeling you are looking for.

Side effects of research chemicals.

- They could have either short term or long term effects depending on the length of use.
- Their short term effects could include disorientation, nausea and vomiting, frightening hallucinations.
- Long term effects include changes in physical appearance which has to do with looking old, wrinkles, a frowning face with red and bulging eyes.
- Changes in behavior such as always being alone, becoming aggressive, reduction in performing at school or work, decreased interest or even hate for once loved people and activities.
- Depression, anxiety, mood changes and feelings of extreme happiness or sadness too are side effects.
- Financial difficulties if funds are misused. Increase in heart rate, seizures, unconsciousness, coma or even organ damage; liver, kidneys, lungs.

How to Store Research Chemicals

Correct storage of chemicals is important to avoid spillage and unwanted reactions among chemicals that are incompatible being stored next to each other or together.

Research chemicals should be stored away from heat and sunlight.

Secondary containers should also be used if possible.

You may want to consider keeping them out of reach for children and practice great housekeeping techniques.

Avoid mixing or storing many together, separate if possible before storing.
